

## SLIDING PATIO DOOR FINAL ADJUSTMENTS

### Tools Required:

Phillips Screwdriver — #2 bit – 6" long shaft

Flat Tip Screwdriver

### LOCK STRIKE ADJUSTMENTS

The lock strike is mounted with four (4) screws. Loosen the screws and adjust the strike up or down as needed.

### LOCK ADJUSTMENT

To adjust the reach of the lock, turn the adjustment screw clockwise to pull the door tighter against the jamb. Do NOT overtighten! When the door is closed and locked, the sliding panel should be able to move 1/16" to 1/8". This small amount of play will NOT affect the security or weather tightness of the door.

## PANEL ROLLER ADJUSTMENTS

The sliding panel rollers can be adjusted independently. Remove the plastic cap on the edge of the panel and insert the Phillips screwdriver. Turn the screw clockwise to raise the panel and counter-clockwise to lower it. Reinsert the cap and adjust the other side as needed.
